Executive Summary

“ Our homes provide the living environment that dictates our future health ”

Sir Michael Marmot

On May 1st 2025, The Healthy Homes, Healthy Kids Stakeholder Meeting brought together clinicians, researchers, policy-makers, housing experts, and families with lived experience to address the urgent connections between child health, housing, and climate change.

Why this matters

- **Child health inequalities remain stark.** Children in Scotland’s most deprived areas face significantly higher risks of illness, particularly from respiratory disease.
- **Housing is a public health emergency.** Cold, damp, and poorly ventilated homes drive respiratory infections, asthma, and poor mental health in children, while also contributing to fuel poverty.
- **Fuel poverty is widespread.** Over 860,000 households in Scotland are affected, with rural and energy-inefficient homes disproportionately impacted.
- **Climate change and net zero policies must be delivered fairly.** Energy efficiency measures can improve health and cut emissions, but potential risks include a reduction in indoor air quality which need careful planning.

New opportunities

- **Data innovation.** New linkages between health, housing, and environmental datasets will enable powerful insights into how home conditions drive health inequalities.
- **Research leadership.** The *Homes, Heat and Healthy Kids* study is addressing critical evidence gaps on how cold, damp housing affects children’s respiratory health and how targeted interventions could improve this.
- **Lived experience.** Parents’ powerful testimonies and animations underscored that research alone is not enough. Families’ voices must shape both policy and solutions.

Key themes from discussion panels

- Energy efficiency retrofits must be tailored, safe, and delivered with occupants, not to them.
- Doctors and healthcare professionals need training on housing as a determinant of health.
- Linking housing and healthcare data can transform policy and practice but must be done in a secure, ethical, and transparent way to maintain public trust.

Next steps

Stakeholders called for:

- **Practical action:** Pilot projects, shared data infrastructure, and evidence-based housing interventions.
- **Collaboration:** Forums to connect researchers, communities, and policymakers.
- **Equity:** Ensuring the transition to net zero reduces, not deepens, inequalities.
- **Amplifying voices:** Embedding lived experience in all stages of research and policy.

In summary, **healthy homes are not a luxury, they are a right.** By aligning research, policy, and lived experience, we can make real progress towards a Scotland where every child grows up warm, healthy, and thriving.

Dr Livvy Swann

Senior Clinical Fellow and Honorary Consultant in Paediatric Infectious Disease
Usher Institute, The University of Edinburgh

Lay Summary

A healthy home isn't a luxury, it's a right.

In May 2025, The University of Edinburgh hosted the Healthy Homes, Healthy Kids Stakeholder Meeting, which brought together over 130 people from more than 50 organisations. Families, doctors, researchers, housing experts and government representatives met face-to-face to discuss the impact of cold, damp homes on children's health.

The problem is urgent. A quarter of a million children in Scotland live in poverty, and many grow up in homes that are too cold, poorly ventilated, or affected by damp and mould. These conditions increase infections, worsen asthma, and harm children's mental health.

Improving energy efficiency can make homes warmer and healthier, while reducing emissions and bills. But without proper planning and ventilation, new risks can emerge. Researchers, including the Homes, Heat and Healthy Kids study, are using new ways to link health, housing and environmental data to design better solutions. Research alone is not enough and families' lived experiences are key to this work.

The message from the day was clear: a warm, safe home is not a luxury but a right, and by working together across sectors, Scotland can make this a reality.

Stakeholders

We were delighted to welcome over 130 in-person attendees from over 50 organisations, including 19 expert speakers and two experts with lived experience.

Organisations represented at the Stakeholder Meeting

Background

Why Child Health Matters

Dr Mairi Stark, Consultant Paediatrician and RCPCH Officer for Scotland

Child health in Scotland is heavily shaped by poverty and inequality, which continue to drive avoidable illness and early death.

In England and Wales, infant mortality rates are more than twice as high in the most deprived areas compared to the least deprived. Children in deprived areas are four times more likely to die from asthma than those in wealthier areas.¹

A key factor is fuel poverty. Cold, damp homes affect every aspect of a child's life: health, education, and wellbeing. Many children arrive at school tired, hungry, or in unwashed clothes.² The tragic death of two-year-old Awaab Ishak in 2020, from mould exposure in social housing, illustrates the severe risks of poor housing conditions.

In Scotland, around 250,000 children live in poverty, and more than half of children from minority ethnic groups are considered "trapped" in poverty.³ These figures have shown little improvement in recent years, and with the Scottish Parliament's child poverty reduction targets looming, the risk of missing them is high.

Climate change will further worsen outcomes, exposing children to heat stress, respiratory illness, and poor mental health. Dr Stark emphasised the urgent need for government and paediatricians to act together to tackle poverty, housing, and climate as fundamental determinants of child health.

Housing as a Public Health Emergency

Michael Tornow, Senior Health Improvement Officer, Public Health Scotland

Housing is a critical determinant of health and, in Scotland, represents a public health emergency. Declining life expectancy and widening inequalities are linked to unsafe, unaffordable, and unsuitable housing.

Housing can affect someone's health directly, through factors such as condition, overcrowding, security of tenure and suitability for inhabitants' needs, and indirectly, through affordability, access to services and social isolation.

Evidence shows that retrofitting homes with energy efficiency measures can⁴:

- Improve mental health
- Reduce mortality
- Narrow health inequalities

However, interventions can create new risks. Poorly designed retrofits may reduce ventilation, worsening indoor air quality and causing overheating in warmer months. Predicted benefits are not always realised due to the "rebound effect" (increased energy use after efficiency gains) or "pre-bound effect" (low-income households already under-heating their homes).

Michael highlighted that energy efficiency measures generally improve physical health, but inconsistent performance and implementation can limit their impact on fuel poverty and mental wellbeing.

Michael stressed that Scotland needs a holistic approach and that warm, safe, and affordable homes are essential to reversing poor health trends, but solutions must be carefully designed, maintained, and evaluated to ensure they work for the most vulnerable.

Fuel Poverty in Scotland

Zach Thompson and Amy Nimegeer, Housing and Regeneration Research Team, Scottish Government

Fuel poverty remains a major challenge in Scotland and is closely tied to both household income and housing quality. A household is defined as fuel poor if:

1. It must spend >10% of income on energy (or >20% for extreme fuel poverty), and
2. Its remaining income falls below 90% of the UK Minimum Income Standard (after housing, childcare, and caring costs).

Latest data from the 2023 Scottish the Scottish Household Survey (SHS) and Scottish House Condition Survey (SHCS) estimated:

- 861,000 households in Scotland were fuel poor.
- Of these, 491,000 households were in extreme fuel poverty.
- 98% of households in the lowest income band are fuel poor.

However, fuel poverty is not solely about income. Property characteristics play a major role:

- Homes built after 1982 +/- high energy efficiency ratings have the lowest fuel poverty rates.
- Rural households and those relying on electric heating face disproportionately high fuel poverty levels.

Importantly, 31% of fuel poor households are NOT considered to be income poor, highlighting that poor housing quality itself can also drives fuel poverty.

Thompson and Nimegeer emphasised the importance of combining statistical analysis with lived experience research, to capture the real impacts on families and design policies that address both income and housing.^{5,6}

Delivering a Just Transition to a Net Zero Scotland

Dr Emily Creamer, Principal Social Researcher of Climate Change Analysis, The Scottish Government

Scotland is legally committed to achieving net zero greenhouse gas emissions by 2045, but the transition must be both fair and inclusive. A just transition means not only reaching the goal, but ensuring that the process tackles inequality and does not leave vulnerable groups behind. This process must be done in partnership with those impacted by the transition.⁷

Progress to date:

- Since 1990, Scotland's total emissions have halved.⁸
- Buildings remain a major source of emissions, with insulation and energy efficiency key to reducing demand.

Barriers to progress remain. The perceived high cost of insulation and retrofitting is a major obstacle for many households.⁹ If not addressed, policies risk deepening inequalities, as wealthier households can upgrade while poorer families remain in cold, inefficient homes.

The Scottish Government is developing a monitoring and evaluation framework for just transition, linked to National Performance Indicators, but significant data gaps persist. Without improved data on how climate policies affect different groups, it will be difficult to measure fairness.

Dr Creamer emphasised that tackling climate change and inequality must go hand-in-hand. Net zero offers a chance to improve health, housing, and fairness, but only if the transition is designed inclusively and equitably.

New Opportunities

New Housing and Environmental Data Opportunities

Stephen Powell and Derek O'Sullivan, DataLoch

DataLoch is a collaboration between The University of Edinburgh and NHS Lothian designed to make better use of routinely collected health and social care data to improve health and wellbeing in Southeast Scotland. Its secure data environment currently holds records for over 1 million people, covering 106 GP practices and more than 20 data sources, including prescribing, laboratory, hospital and demographic data.

By linking patient-level health data with housing and environmental information, DataLoch can help uncover the hidden drivers of poor health. For example, linking with air pollution, climate, and housing condition data would allow researchers to study how these exposures influence respiratory illness, particularly in children. This approach has already been used within the *Homes, Heat and Healthy Kids* study, which connects geospatial housing data with children's health records using the Community Health Index (CHI) number.

However, challenges remain, such as incomplete address records, multiple household moves, and postcode changes. To address this, DataLoch is working on creating an environmental data spine to enable reliable, large-scale analyses.

Ultimately, DataLoch aims to provide a collaborative and accessible dataset that allows researchers, clinicians, and innovators to develop more effective policies and care interventions for healthier, fairer homes.

Homes, Heat and Healthy Kids Study

Dr Livvy Swann, Principal Investigator

Dr Swann is leading the *Homes, Heat and Healthy Kids* study, which is addressing the urgent links between cold housing, fuel poverty, and children's health. The study is linking housing and health records for all children under 5 years old, drawing on 4 million child-years of data across ~230,000 properties in Scotland. This study aims to identify children in underheated homes, estimate the number of preventable infections caused by underheating, and assess how different ways of making a home affect a child's risk of respiratory infection.

Scotland faces a combination of challenges: old housing stock, a cold climate, and rural communities. Underheated homes are due to the combination of the property's age, type and composition alongside fuel poverty, which has been becoming more prevalent with rising fuel costs. The underheating of homes leads to cold, damp and mould, which are directly linked to illnesses that cost the NHS over £2.5 billion each year in the UK¹⁰. Young children are particularly at risk as they spend most of their time at home during a crucial period for lung and immune system development.

Cold homes can decrease children's respiratory tract defences, increasing respiratory infection rates, while damp and mould also increase their risk of asthma^{11,12}. Making homes more energy efficient can make them warmer and cheaper to heat, but without proper ventilation it can also increase indoor air pollution which can worsen respiratory health.

By filling a critical evidence gap, the project aims to inform housing and climate policy, reduce respiratory illness, and promote health equity in the move toward net zero.

Lived experience

Gloria Odhi, Andrew Anderson, Anwar Arif

As part of the *Homes, Heat and Healthy Kids* study, a new group of families who have lived experience of raising children in cold homes have come together across Scotland, known as The Parent Group. They have been integral in shaping the study questions and direction. Together with the study team, The Parent Group developed an animation about the link between cold damp homes and childhood chest infections, as well as short personal videos to share their lived experiences of fuel poverty and poor housing. These powerful pieces highlighted that lived experience is expertise and a vital complement to research evidence.

The films offered powerful, personal perspectives.

Gloria's film explained how storytelling through animation can engage audiences on a human level, while protecting anonymity when needed. Her work showed that ethical storytelling can be a catalyst for policy change.

Andrew's film, "Have you ever had to stretch a pound?", described the daily realities of families unable to afford washing clothes or heating homes, and how temporary fixes like blankets or curtains fail to address the problem. His call was for urgent, long-term solutions.

Anwar's film, "From Pain to Power," conveyed the anxiety of parents watching children cough through cold nights. He stressed that fuel poverty is not a personal failing but a systemic one, and that parents' voices must be heard.

Together, these films underscored the importance of embedding lived experience in policy discussions. They showed that behind every statistic are families who need lasting, dignified solutions to make homes warm, safe, and healthy.

Panel Discussions

The Practicalities and Health Impacts of Energy Efficiency Measures

Megan Brownlie (Energy Saving Trust), Jenny Danson (Healthy Homes Hub), Professor Ruth Doherty (The University of Edinburgh), Nile Istephan (Elidon Housing Association), Dr Abi Whitehouse (Queen Mary University London), and Dr Julio Bros-Williamson (The University of Edinburgh)

Chair: Dr Livvy Swann

The panel brought together experts from housing, energy, engineering, and public health to discuss the opportunities and challenges of improving home energy efficiency.

Panel members stressed that no two homes are the same, so retrofitting requires tailored solutions. Social landlords highlighted practical difficulties, such as the disruption caused by works and the mismatch between intended and actual use of properties (e.g., overcrowding). The importance of communication with tenants was emphasised, with follow-up over at least two heating seasons to ensure retrofits deliver their intended benefits. The panel also highlighted that new technologies can be ineffective if residents are not trained in their use.

The panel noted the health sector's role: many children affected by poor housing conditions are not seen in primary care, yet may suffer long-term complications such as asthma or COPD. The lack of medical school training on housing as a determinant was also highlighted with strong suggestions to bring this into core curricula in doctors' training.

Linking Housing and Healthcare Data

Oliver Berry (Smart Data Foundry), Professor Chris Dibben (The University of Edinburgh), Rochelle Hadley (Switchee), Pamela Linkstead (DataLoch), and Simon Tricker (UrbanTide)

Chair: Stephen Powell (DataLoch)

The panel explored recent advances in connecting housing, environmental, and healthcare datasets, and the opportunities this creates for improving child health.

DataLoch and UrbanTide described a breakthrough in linking Unique Property Reference Numbers (UPRNs) with Scotland's Community Health Index (CHI), enabling researchers to track how housing conditions relate to health outcomes at the individual and household level. This opens the door to studying shared exposures, such as damp homes or air pollution, across families and communities.

Switchee demonstrated how smart thermostats can collect real-time data on temperature, humidity, light, and pressure. These data can identify risk of mould and fuel poverty, and could in future be linked with health records to provide early warnings for vulnerable households.

Smart Data Foundry showed how financial data can reveal patterns of income and spending, highlighting where fuel poverty overlaps with income poverty.

The panel also discussed challenges. Defining a "household" can be complex, while linking datasets raises important issues of privacy and confidentiality. Secure data environments and pseudonymisation are essential safeguards.

Overall, the discussion highlighted that responsible data use could transform understanding of how housing drives health inequalities, while ensuring communities remain at the centre of decision-making.

DATA PANEL - LINKING HOUSING & HEALTHCARE DATA - OPPORTUNITIES & CHALLENGE

Rochelle Hadley · Chris Dibben · Pamela Linkstead · Simon Tricker · Oliver Berry · Stephen Powell

Summary panel discussion

Dr Emily Creamer, Dr Mairi Stark, Dr Abi Whitehouse, and Prof Chris Dibben.

Chair: Dr Livvy Swann.

The closing panel brought together experts from health, housing, and climate research to reflect on the day's discussions and identify key priorities for action.

A recurring theme was the importance of communication and empowerment. Occupants need clear information about their rights and practical support tailored to their circumstances. Stronger communication channels between landlords, housing associations, and local authorities can ensure interventions are responsive and effective. Equally, communities need accessible ways to share their experiences, reducing stigma and isolation.

The panel also highlighted the role of the health sector. Doctors should be trained to recognise housing as a health determinant, integrating questions about housing into medical histories. Updating medical education in this way could improve early detection of housing-related health risks.

Another key theme was the potential of data. With new linkage methods now available, responsibly combining health, housing, and environmental data offers unprecedented opportunities to design better policies. But alongside technical progress, it is vital to embed lived experience throughout the process, ensuring that solutions are shaped by those most affected.

The panel concluded that addressing unhealthy housing requires collaboration across disciplines and sectors, uniting data, research, policy, and lived experience to create lasting change.

What Next?

The attendees of the conference were invited to share their thoughts from the day, summarised here.

What key messages have you taken away from today?

1. Power and limitations of data

- Enthusiasm for the potential of linked datasets to drive change.
- Data must be used responsibly, with attention to quality, limitations, and real-world impact.
- Existing big data is underused, there is a need for better data sharing and integration.

2. Housing and health connection

- Indoor air quality and housing are deeply tied to child health outcomes.
- Housing must be seen as a home, not a commodity.

3. Collaboration and storytelling

- Emphasis on interdisciplinary working, joined-up thinking, and collective commitment.
- Importance of storytelling and lived experience, to bridge gaps between research and community.

4. Policy and practice gaps

- Frustration that despite good data, significant policy or systems change is lacking.
- Engaging wider audience more meaningfully, especially communities and frontline professionals.

What should our next steps be as a group of stakeholders?

1. Communication and dissemination

- Requests for shareable summaries, contact lists, and updates to maintain momentum.
- Suggestions for forums, coalitions, or a “coalition of the willing” to continue collaboration.

2. Engagement and inclusion

- Calls to broaden participation, especially amplifying voices of those with lived experience.
- Suggestions for more collaborative workshops to co-create solutions.

3. Actionable collaboration

- Focus on practical next steps: small pilot studies, shared data infrastructure, cross-sectoral collaboration.
- Desire for ongoing education, especially for health professionals (e.g. IAQ education packs).

4. Strategic alignment

- Need to engage policymakers and share benefits equitably.
- Clarify collaborative opportunities and ensure transparency and integrity.
